

This is the RootMe ctf from tryhackme.

Every step there the same as Vulnveristy except priviledge escalation.

Here we instead have /usr/bin/python with super user priviledge. To exploit this search for gtfobins and go to the first website and then search for python. To spawn a new shell with super user priviledge use `python -c 'import os; os.system("/bin/sh")'`.

Root Aquired!
